

My experience building a personal portfolio website started when my teacher assigned a collaboration project with several tasks to complete. One of them was to build a portfolio website individually, and it became one of the most challenging yet rewarding tasks I had to do.

I started by designing the layout in Figma, picking a blue, white, and dark navy color palette for a clean and professional look. Once the design was ready, I coded it using HTML, Bootstrap, CSS, and JavaScript. The trickiest part was embedding a Spline 3D viewer, removing its watermark required dealing with shadow DOM manipulation, which took a lot of research and trial and error.

It was tough working through it alone, but finishing the portfolio taught me that good design and solid code must go hand in hand. It's one of the tasks I'm most proud of completing.
